

## ***Long-distance pneumatic conveying with minimal degradation/demixing***

AZO, Osterburken, Germany, has introduced the MULTIAIR dense phase conveying system. Variable positive transport pressure within the 1-4 bar range can be adjusted to suit the type of product being conveyed and the desired performance. The system is particularly well suited for use with abrasive products such as PVC dryblend and fibreglass-reinforced

granulates as well as for handling foodstuffs such as breakfast cereals or milk powder where low levels of demixing are required. The extremely low transport speed is gentle on the product while at the same time reducing wear on the system. The broad transport pressure range provides for high capacities as well as for long conveying distances. The control system can be optimised for the product in question while the targeted input of secondary air allows for the attainment of high energy efficiency. [www.azo.de](http://www.azo.de)
