

System combines best of vacuum and positive pressure pneumatic conveying

Along with the introduction of its MULTIAIR dense phase pneumatic conveying system (see last week's Industry News) AZO, Osterburken, Germany, has announced its new VacuumPlus conveying system which intelligently combines the advantages of suction and pressure

transport. It is said to be ideal for conveying fragile and thermally sensitive bulk products without either damaging them or causing dehomogenisation, thanks to its slow dense phase conveying action. The system, which is very efficient owing to its low air and energy consumption, is recommended for medium performance levels and distances at present up to 100m. The design is fairly straightforward even when several product loading stations are involved.
