

## ***Food-grade bagging line sets new hygiene standards***

BTH (Bag Treatment Holland) of Eersel, the Netherlands, has introduced the VLP-600-2BO ultra-hygienic bagging system has been engineered in accordance with EHEDG guidelines. The revolutionary new machine, which is of modular construction, has been arranged in zone formats. For example, moving structural parts and controls are located outside the functional space as much as possible (the functional space being the area where the bag is filled and closed). This prevents contamination and dust entrapment while facilitating speedy cleaning of the machine. Featuring the under-level principle of dust dispersion, it has a maximum capacity of 600 bags/h.
