

Advantages of BlockTop bag closure system

Chronos BTH, headquartered in Eersel, the Netherlands, has released further details about its recently introduced BlockTop™ bag closing system which is employed in conjunction with its novel bottom-up bag filling technology. After filling the bag top is pre-cut, creased, double folded and hot melt glue is applied between the folds. The bag top is then pressed to spread the glue. Each closed bag top is folded over and further glue is applied. The folded bag top is pressed on to the filled bag to form a square-shaped package.

BlockTop sealed bags are easy to open, by simply pulling across the top of the bag, which is then unrolled. As an added advantage the bag top can then be refolded to close it again. A further bonus is that the filled bags are an ideal shape for palletising and subsequent stretch hooding. When enhanced closure security is required, the system has the flexibility to be used with conventional sewn closure methods. www.chronosbth.com
