

### ***Dosing system for rubber compounds***

Color Service, based in Dueville, Italy, has introduced a new dosing system for automatic weighing of components used in rubber compounds. It is capable of preparing a bagged recipe in less than one minute, all the ingredients being dispensed simultaneously. The process involves:

- Creation of EVA bags from tubular film
- Automatic transfer of the bag to the dosing area
- Printing of the bag with ID label (bar code, normal lettering, etc)
- Sealing of the bag and dispatch.

The system is reported to work effectively even with problematic products such as titanium dioxide, zinc dioxide, sulphurs, waxes and resins. [www.colors-service.eu](http://www.colors-service.eu)
