

## ***Contract processor ensures high levels of product purity***

Ebbecke Verfahrenstechnik, Bruchköbel, Germany, specialising in contract processing of bulk materials, has developed its own “Demagnetic” inductive metal detector system. Thanks to its high sensitivity it is capable of identifying even the smallest metal contaminants, which are then separated immediately along with the surrounding material via integral flap gates. A dosing unit with conical bunker ensures even feed of product past the metal detector. Customers are already using the system to reliably clean batches of product contaminated by metal particles.
