

Quality control during contract processing

Contract bulk material processing specialist Ebbecke Verfahrenstechnik, Bruchköbel bei Frankfurt-am-Main, Germany, is able to offer its patented Planoscreen system for applications where a customer needs to decontaminate his material by removing particles of a measurable different grain size or grain shape. The system, which was invented by the company, consists of a combination of ascending separators and long-stroke screens, allowing impurities with a different specific weight to be separated from the raw material. In cases of contamination by undesirable humidity, there is the availability of screen driers, fluidised bed driers and infrared driers which are capable of providing a continuous reduction of unwanted humidity, thereby ensuring a homogeneous level of residual humidity. As reported in last week's Industry News, Ebbecke has also developed a novel inductive metal detector system which is now available to its customers. www.ebbecke-verfahrenstechnik.de
