

## **Software facilitates maintenance and documentation tasks**

Endress+Hauser, headquartered in Switzerland, chose the occasion of this year's Hanover Fair to launch the latest version of its W@M Enterprise software which has been designed to help users to plan, carry out and document maintenance tasks in all areas of process engineering plants. The easy web-based access to information and documentation relating to measuring and control technology within a company's entire network, the automatic provision of data and update of master data and the intuitive user interface all combine to increase the efficiency of maintenance processes.

The integrated task scheduler helps users in planning, carrying out and documenting all maintenance activities. Integrated analysis functions help when performing daily tasks, from planning measures in the entire area of E, I & C (electrical, instrumentation and control) technology to the storage of required spare parts. In the new version W@M Enterprise 3.03, improvements have been made in the area of automatic provision of information. The software can now be installed and operated on a server within the company's network, on a workstation or laptop without the need for a permanent internet connection.
