

Eriez adds bullet magnets to ProGrade range

Following the recent launch of its competitively priced ProGrade grate magnets (see Industry News for week of 18 January), Eriez Magnetics Europe has announced an extension to the range with the addition of bullet magnets. As with the grate magnets, these also are now available in standard sizes immediately from stock. The company's permanent rare earth bullet magnets offer an efficient method of recovering metal contamination when conveying dry, free flowing materials in pipelines. The product enters the housing of the bullet magnet and is distributed evenly over the magnetic poles by a solid steel cone. Any ferrous contamination is attracted to and held by the magnet until it is removed from the flow by opening the door and manually cleaning it. They are of stainless steel construction with a glass bead surface finish and can be installed in any gravity-fed application. www.eriez.com
