

Swiss-designed ultrasonic sieving system now available in UK

Farleygreene of Aldershot, UK, has been appointed British Isles distributor for the new Sonotech ultrasonic sieving system developed by Artech Systems of Switzerland. This type of technology is employed to eliminate mesh blinding and can accelerate throughputs by as much as 400% in some instances. While older systems employ a single wave frequency which can lead to hot spots resulting in premature mesh failure, the Sonotech system has a continuously varying wave applied to the mesh screen. It can be easily fitted to Farleygreene's Sievmaster range of screening machines. www.farleygreene.com
