

Reclosing explosion vent panel

Fike Europe, Herentals, Belgium, has brought out the new reclosing FLEX-V (fire-limiting explosion vent), a high-performance vent panel designed to protect industrial process equipment against the pressure effects of dust and gas explosions. The unit recloses after explosion venting, allowing for more effective post-explosion fire fighting. After venting the explosion pressure, the vent panel will close again up to 90%. This significantly reduces the venting process and eliminates risk of secondary explosions. The device can be retrofitted to existing equipment installations. www.fike.be
