

Sanitary high-lift drum dumper

UK-based Flexicon (Europe) has introduced a hygienic TIP-TITE discharger which allows drums to be loaded at floor level, sealed against a discharge cone, elevated and tipped, mating

the cone to a gasketed receiving ring on downstream process equipment. It can accommodate drums of 115-210 litres capacity, discharging bulk material into process vessels and equipment inlets 1525-3050mm above the plant floor. A pneumatically actuated slide gate valve prevents material flow until the discharge cone has been properly seated in the receiving ring. The all-stainless unit can be finished to sanitary or industrial standards. Other models are offered in mild steel with durable industrial coatings or with material contact surfaces of stainless steel.
