

Freeman Technology appoints new distributors in Asia

Powder characterisation company Freeman Technology, Welland, UK, is significantly expanding its activities in Asia with the appointment of distribution partners in the region who will sell and support the company's FT4 powder rheometer. DKSF, an established organisation which operates in 35 countries and has a particular focus on Asia, will represent Freeman in Singapore, Malaysia, Thailand and Taiwan. The new partner in India

will be Aimil Ltd, a respected distributor of analytical instrumentation, which serves the sub-continent via 10 strategically located offices and some 50 channel partners.

According to director of operations Tim Freeman, the growing demand for the company's universal powder tester in these fast expanding markets means that additional local support is now needed. The FT4 powder rheometer is a universal powder tester that uses patented dynamic methodology, fully automated shear cells and several bulk property tests – including density, compressibility and permeability – to quantify powder properties in terms of flow and processability.
