

Continuous mixers

The GCM range of continuous mixers made by Gericke, Regensdorf, Switzerland, is widely recognised for its high level of mixing homogeneity and hygienic design. The ATEX-approved series has now been further improved with the introduction of the models type GCM ECB. With the latest design it is now possible to extract the drive and the mixer housing for easy access. The unit has three operational positions: one mixing position and two cleaning positions. The GCM 800 ECB and the 1200 ECB are equipped with cantilevered shaft and a shaft seal which can be dismantled completely in a very simple manner. With the hygienic version, machine parts that come into contact with the product are polished. The unit has been designed with the elimination of all hollows or crevices where residues might otherwise accumulate. www.gericke.net
