

## ***ROTOCLASSIC rotary packer sets new bag filling record***

Haver & Boecker, Oelde, Germany, reports that one of its Type 16 RCC HAVER ROTOCLASSIC rotary bag fillers installed last October at the Valencia, Spain, plant of Cementos La Unión has been breaking previous bag filling records. The 16-spout machine, which packs standard grey cements fully automatically, has shown itself capable of achieving outputs of 5700 bags/h with 25kg bags and 4700 bags/h with 35kg bags.

It replaces a Type 8 RS MEC HAVER ROTO-PACKER built in 1997 which will be put into operation at one of the company's plants at Pointe-Noire, Congo-Brazzaville. Thanks to the 16 RCC's compact design, it was possible to install the new packer in the same spot as the lower-capacity 8 RS MEC. Existing ancillary equipment such as the bucket elevator and the screening machine could be put back into operation after partial modification. In addition a Type 5000 HAVER RADIMAT bag applying machine, a complete bag discharge and handling line with bag cleaner, bag check weigher, and bag diverter with bag shredder were installed. Despite its very high capacity the new packing machine uses just a single bag discharge line and is supplied with empty bags using a single bag applying machine. Since the launch of the ROTOCLASSIC two years ago more than 100 units have been sold worldwide and over the 50 year ROTO-PACKER history some 3500 systems have been sold.
