

Combined hygienic FIBC discharger/sack dump station

J-Tec Material Handling, Kapellen, Belgium, part of the Katoen Natie Group, has introduced a compact FIBC discharge station which incorporates a separate sack dump facility. Both are fabricated to EHEDG standards. The FIBC discharger offers a 100% dust-tight clamp, a vibrating dish to promote positive product outflow, a pinch system for reclosing the FIBC

and a solid silicon seal which is FDA approved and easy to replace. The sack emptier is simple to clean and has been designed with rounded edges. It is also available in CIP execution with a door which is 100% dust-tight. The standard version offers a variable outlet, aeration nozzles and connections for dedusting, level detection, etc. This two-in-one discharger will be shown on the J-Tec stand at Powtech (9-447) along with the company's dosing valve, a display model of a pneumatic conveying system with dense as well as dilute phase capabilities, and a module for container filling and discharging. www.j-tec.com

J-Tec's combined FIBC discharger/sack dump station meets highest standards of cleanliness
