

Hot-galvanised pipework for solids handling

Fr.Jacob Söhne, Porta Westfalica, Germany, is now offering a new hot-galvanised pipework system with 3mm wall thickness which has been specially designed for conveying bulk goods in outdoor areas. The system was developed in response to customer requirements in the grain industry but is suitable for use with a wide range of abrasive bulk materials. The standard range includes 500, 1000 and 2000mm lengths of straight pipes, segments, cone pieces, 45-degree forks, spouts from square to round and inspection sections. Also included in the range is a hot-galvanised two-way valve available in powered or manual versions. The various components provide a simple-to-install modular system, with tightly sealed connections made quickly and easily using galvanised pull-rings with sealant. A choice of diameters is available. www.jacob-rohre.de
