

Hard steel offers cost-effective protection against moderate wear

Kalenborn of Vettelschoss, Germany, has extended its range of abrasion-protection products with the introduction of KALMETALL-HB hard steels which are available in a choice of different specifications. Typically with a hardness equivalent of around 400 Brinell, although harder categories are available, KALMETALL-HB has been designed to provide high wear resistance and impact strength combined with adequate toughness. These properties allow for good workability and the product is equally suited for forming and welding. Normally forming does not require heat treatment and the product can be cut, drilled or milled as required. This allows for fabrication of complete components such as cones, separators and dust collectors. www.kalenborn.de

Screens for a variety of basic industries can be economically fabricated from KALMETALL-HB
