

## ***Monitoring performance of vibratory conveyors***

Key Technology of Beusichem, the Netherlands, has launched SmartArm, a wireless performance monitoring system for Iso-Flo vibratory conveyors that enables users to verify performance at any computer workstation. The system measures and reports speed and stroke to provide real-time analysis of shaker function. It also warns when speed or stroke are out of tolerance. Conceived at Key's US head office, the system provides an early warning for maintenance personnel to take action and prevent unplanned downtime. [www.key.net](http://www.key.net)
