

### ***Rotary valve with advanced dust sealing system***

Kongskilde Maskinfabrik, Sorø, Denmark, has developed the RF20 S rotary valve which incorporates an improved sealing system. This consists of a combination of sealing rings and specially produced components which are installed in the area of the valve where the shaft passes through the sides of the housing, in such a way that dust cannot pass into the atmosphere or into the bearings. It has shown very good results in trials involving pneumatic conveying of ground rubber granules as well as pulverised plastic materials.
