

Compact palletiser for bags and unit loads

Newtec, Rousset, France, has completed its range of palletisers with the introduction of a compact cost-effective machine for low pallet volumes. It is available in versions for handling either bags or unit loads: for bag palletising applications the PAL 500 series offers throughputs from 300 to 800 bags/hour, whilst for boxes, cases, etc, the PAL-PACK 3300 version can handle up to 1400 unit loads per hour. The compact, highly versatile machine has been designed for easy operation and to occupy minimum floor space. It achieves low noise output and reduced energy consumption.

Available options include: automatic empty pallet infeed and full pallet outfeed; automatic sheet distribution; wrapping at the palletising station; and full pallet outfeed from the palletising station by AGV. The machine was launched this week on the Newtec stand at the EUROPACK-EUROMANUT exhibition, Lyon, France. www.newtec-group.com
