

## ***Palletising and wrapping by one machine***

In response to customer requirements, Newtec Bag Palletizing of France is now offering an integrated overwrapping machine as part of its G300 palletiser and several examples of the new dual machine have already been delivered to customers. The Illzach-based subsidiary of the Newtech Group has engineered a solution which allows the combined starting of the palletisation cycle for the first three to four bag layers and of the overwrapping cycle, the two operations running simultaneously. The new machine accommodates bags in the 5-50kg capacity range and covers outputs up to 300 bags/hour. Options to accept interlayer and cover sheets and/or a bag flattening device are available. Advantages of the combined

palletising and overwrapping system include: easy operating and maintenance conditions, competitive price for the two operations of palletising and overwrapping, reduced footprint compared with using two separate machines, and quick return on investment. Newtec currently has over 1500 palletising installations operating worldwide in food, building material and chemical industries.
