

## ***Digital filtering can enhance weighing speeds by 25%***

The digital filtering system that forms part of the FLEX weighing instrumentation recently introduced by Penko Engineering of Veenendaal, the Netherlands, is simple to set up, easy to visualise and has shown itself capable of significantly increasing measuring speeds. When activated, the filter embodied within FLEX provides just two settings: for either static or dynamic measurement applications. For a recent customer who replaced an older instrument with a FLEX, this new digital filtering method enabled one machine to increase its weighing performance by as much as 25%.
