

Plastic pellets loaded into 20ft containers in just 8 minutes

Redler of Stroud, Gloucestershire, UK, a division of Germany-based Schenck Process Group, has supplied two of its FulFiller belt thrower type container loaders to separate sites of Borealis Italy for horizontal filling of polymer granules into 20ft lined containers. The units

can achieve loading rates up to 250m³/h, which means that a container can be filled with a 19t load of plastic pellets in no more than eight minutes. Careful design of the inlet ensures both gentle handling of the product as well as maximum use of the container volume. Power consumption is low and maintenance is straightforward. Machines can be delivered ready for operation usually within two weeks of an order being signed. www.redler.com
