

Retsch relocates in Germany and UK

Retsch, specialising in the manufacture of laboratory milling and sieving equipment for sample preparation and characterisation of bulk solids, has moved to a larger purpose-built head office and production plant at Haan, Germany. Sister company Retsch Technology (optical particle analyzers) is also accommodated at the new address: Retsch-Allee 1-5, 42781 Haan (tel: +492104/2333-100).

At the same time the British subsidiary Retsch (UK) Ltd has transferred from its previous address in Leeds to brand new facilities, which include a spacious demonstration laboratory, at Unit 3, California Drive, Castleford, West Yorkshire WF10 5QH. The modern laboratory currently houses some 20 instruments, including four new machines: an SM300 cutting mill, a new cryomill tailored for cryogenic grinding, an AS200 Jet air jet sieving machine, and a GM 300 Grindomix. Further new instruments will follow in the coming months.

UK sales director Simon Rundstrom commented: "The new facility will give all our customers the opportunity to visit, run samples and find the right solution to meet their preparation requirements." Retsch is part of the Dutch Verder Group. www.retsch.com
