

New products for milling and sieving

Haan-based Retsch, the leading German solution provider for the preparation and characterisation of solids, has launched a new generation of cutting mills with the introduction of the models SM 100, SM 200 and SM 300. This last machine is the most powerful and features variable speed. They are all characterised by simple controls and ease of cleaning. In the field of sieve analyses the company has launched the AS 450 Control vibratory sieve shaker which can efficiently separate up to 20kg of material, so that no manual re-sieving is required. Also new is the AS 200 Jet air jet sieving machine designed for use with fine powders which tend to agglomerate. Average sieving time is only 2-3min. These innovations will be shown at the forthcoming analytica and Powtech exhibitions.
