

## ***Particle analyzer finds favour across broad range of industries***

Retsch Technology, Haan, Germany, reports that its new CAMSIZER XT optical particle analyzer, launched in March 2011, has proved successful beyond all expectations. The unit, which extends the applicational range of the well proven CAMSIZER into smaller particle sizes and agglomerating materials, has been well received by the market. Many new customers in Germany and other countries are using the device for a wide range of applications including characterisation of construction materials, food and pharmaceutical products. The possibility to analyse not only the particle size (in a range from one micron to 3mm) but also the particle shape is perceived as an important benefit. A choice of convenient dispersion options allows for perfect adaptation of the instrument to specific user requirements. [www.retsch-technology.com](http://www.retsch-technology.com)
