

## ***Screening ultra-pure polycrystalline silica***

Rhewum of Remscheid, Germany, in June delivered screening machines to a new polysilica plant in Taiwan which will have an initial capacity of 5000t/yr. The crushed silica will be classified from fine to coarse grades on a 5m long conveying/separating line prior to further processing. The machines, which are scheduled to be commissioned at the end of the year, are modified versions of the Rhewum Rius adapted to meet the specific requirements and high throughputs of this application.
