

### ***New HDPE grades ideal for IBCs***

The Sittard, Netherlands, polymers division of SABIC has introduced two new high density polyethylene grades which are especially suitable for blow moulding applications in the construction of intermediate bulk containers and tanks of up to 1000 litres capacity and above. They will be featured at this year's K-Show (Hall 6 Stand D42). SABIC HDPE ICP5602 has been developed for applications in tight head drums up to 220 litres and above, while the new UV-stabilised IBC grade designated SABIC HDPE ICP4907S is designed for production of larger vessels. Both grades meet strict requirements for food packaging and have an outstanding stiffness/impact balance, environmental stress crack resistance and chemical resistance, providing excellent protection for storage of hazardous substances and valuable liquids. They can be used for production of UN-approved containers and offer manufacturers greater cost efficiency. Riyadh-headquartered SABIC (Saudi Basic Industries Corporation) ranks among the world's top six petrochemical companies. [www.sabic-europe.com](http://www.sabic-europe.com)
