

## ***Belt scale integrators offer enhanced efficiency in simple and complex applications***

Siemens Industry Automation division, Nuremberg, Germany, has improved its Milltronics BW500 belt scale integrator, while adding a new version – the Milltronics BW500/L – to its portfolio. The new version, developed specifically for simple applications with belt scales, has two relays. It calculates rate, totalised weight, belt loading and belt speed. An automatic calibration function saves time during operation. Both versions store parameter data in a non-volatile Flash memory. The standard Milltronics BW500 comes with five relays, offers additional PID control and batching in its functionalities and is specially designed for complex applications.
