

Safety relay can monitor machine speed and standstill at same time

Siemens Industry Automation Division has launched the Sirius 3TK2810-1 speed monitor which is capable of measuring standstill and speed of machines and plants. The device can simultaneously monitor three limit values for downtime, set-up and automatic speed. It is set with menu guidance, for example speed limits defined, via buttons arranged on the front of the device and an LCD display. Diagnostics and status information are displayed in plain text with several LEDs to facilitate early detection, for example of faults, thereby reducing downtime and increasing plant availability. www.siemens.com/industryautomation
