

Cleaning-out-of-place washer

Suncombe, Enfield, UK, has introduced the 2011 ImmersionWasher™ range of COP (cleaning-out-of-place) washers. They are designed to clean hoses, pipes and miscellaneous components, using high-temperature liquids and strong chemicals. A combination of technologies minimises energy consumption while reducing washing time and manual handling. The choice of recipes includes immersion, turbulence, recirculation and spray cleaning. Additional steps can be incorporated within the washers from drying, cooling, draining and forced venting to an external location.

The equipment offers an enclosed means of washing items that traditionally are manually cleaned, providing a repeatable cycle for guaranteed results. Available in a wide range of standard sizes, the units can be built to sanitary standards for food and associated applications, with versions available in manual and automatic operating modes.
