

## ***Chemical drumming facility also accommodates IBCs***

Suttons Group, the leading UK-based bulk logistics operator, has broadened the range of services available to its customers with the successful implementation of a chemical drumming facility at its St. Helens site. Designed primarily to handle chlor vinyls for Ineos, the installation has an empty drum storage magazine capable of simultaneously handling six different drum types and a total capacity of 1584 drums. Two fully automatic filling machines are each capable of filling 60 drums/hour, with an additional pallet filler capable of filling different size drums and intermediate bulk containers. It currently handles five different product streams which are delivered into the plant by dedicated Suttons road tankers. [www.suttonsgroup.com](http://www.suttonsgroup.com)
