

## ***Drying, cooling & classifying in one machine***

New from Sweco Europe, Nivelles, Belgium, is the DC Classifier, a multi-functional unit capable of drying, cooling and classifying. Developed by the US parent company specifically for the plastics industry, it is also suitable for a variety of dry applications requiring one, two or all three of its capabilities. It uses either positive or negative air flow to draw moisture and heat away particulates to dry and/or cool the material, which then continues through the machine to the classification stages where oversize and fine particles can be removed.
