

## ***Sifter combines high capacity with high performance***

Sweco, Florence, KY, has introduced the BigMax™ gyratory sifter which offers the potential for 22m<sup>2</sup> of screen area combined with 3.7m of screen deck length, making the machine especially well suited for long retention time and accurate product separations. Following on from the successful GyrMax range of sifters, the new unit now adds high-capacity screening to the many innovative features of the earlier series.

The BigMax, which is the largest sifter to date from this manufacturer, is sufficiently flexible to allow one to four separations in a single machine, depending on the desired deck configuration. This degree of versatility is possible thanks to the unit's ability to feed material at a single point or independently to each deck. The screens can be easily replaced from either end of the machine without the need to remove the ball trays. Sweco's European head office is in Nivelles, Belgium.
