

### ***Iris valve with compact control handle***

New from Vortex Valves Europe, Darlington, UK, is its Iris Valve™, available in various sizes within the 100-450mm range. It is equipped with a compact handle to control, shut off, or meter flow of powders, granulates or pellets for gravity flow applications. It is well suited for use with intermediate bulk containers, especially where access space is restricted. The valve, which can cope effectively with moderately abrasive products, is also available with a quick-release coupling for use in the pharmaceutical industry. The patented Iris Valve design features several trigger lock positions. The control ring and handle are both made of stainless steel and the valve's inexpensive form-fitted fabric sleeve, which can easily be replaced, is ideal for closing on delicate or friable materials.
