

## ***Rotary feeders with up to 25% increased performance***

Zeppelin Systems, Friedrichshafen, Germany, has launched a new range of rotary feeders which has been under development since 2008. Based on the company's existing rotary feeder programme, the new series has been completely revised and optimised. It includes the CFM medium-pressure (up to 1.5 bar) and the CFH high-pressure (up to 3.5 bar) feeders. Martin Frank, general sales and engineering manager at Zeppelin Systems, explained that thanks to their modular design the new feeders could be tailored to the exact requirements of the user, in addition to which quick delivery of spare parts as well as straightforward adaptation to modified operating conditions were assured. By achieving the best possible inlet cross section-to-capacity ratio combined with an optimum sizing of feeder housing to rotor, a performance improvement of up to 25% has been achieved. They are available in a choice of stainless steel, aluminium, or grey cast iron with different surface treatments.
