

Ensuring virtually total contents discharge from mixers

amixon, the leading specialist mixer manufacturer based in Paderborn, Germany, will be featuring its new ComDisc® system (short for “Complete Discharge”) at Powtech on stand 9-363. The device is capable of ensuring that up to 99.997% of the contents of a mixer are emptied. The company points out that many mixer manufacturers are able to achieve a high degree of product homogenisation, but far fewer are able to guarantee virtually zero residue after discharge.

ComDisc from amixon

With the ComDisc system, the lower mixer arm is fitted with one or more wings and, as the filling level decreases, the ComDisc elements turn in the direction of rotation and gently scrape the mixture residues towards the outlet. The device does not come into contact with the floor of the mixer. The system is available with all new amixon mixers and can also be retrofitted to existing machines.
